

Fiona Chan (Account Manager, Enterprise Group):

I think all sectors need IT to support their business operations, and IT can help different companies to enhance their operational efficiency and competitiveness. More importantly, IT can bring a reformed business model for the new generation.

Solomon Leung (Technical Consultant):

You will not record transaction information in an account book for settlement as before. Nowadays we usually use Excel, i.e. computers, to record information. For enterprises, they cannot rely on personal computers and Excel software only to cope with daily business needs. At this time, enterprises will rely on IT companies to provide IT solutions for them, so that they can cope with the huge demand for data updating every day. What technologies should be deployed in these solutions to ensure a smooth operation? This is exactly the problem that IT practitioners are required to solve.

Wong Tsz Yui (Account Executive, Commercial Business):

Joining the IT industry broadens your mind and you will see more different things. IT is playing a front-line role in the daily operations of various companies so that IT practitioners are not responsible for supporting work only as before. Nowadays IT practitioners are standing in the front line advising the company of its positioning in the next 5 to 10 years or even in just a few hours.

Solomon Leung (Technical Consultant):

Nowadays we often hear about “destructive innovation”. In fact, with the emergence of innovative technologies, all sectors have to adapt to the trend of IT application and even change their business models with these technologies. For example, Hong Kong’s GoGoVan (a company offering van-hiring services mobile app) applies new technologies that did not exist before to re-introduce van-hiring services to everyone.
