

Overall, it covered very well different digital needs of many areas especially 弱勢社群. It's very important to help them to fill the gap. That's very good point.

ICT strategy for a government shouldn't be what areas of technology we should do in coming years but how ICT can assist our people in the area they concern. Other than underprivileged groups, I think what citizen concern nowadays are:

How ICT "efficient" our city green? (Reducing Carbon, reducing cost in long run. Efficient use of ICT is very important. For example, I may disagree with the Free Wifi project but sure, I need data support on utilisation before further comments.)

How ICT "efficient" our democracy development?

How ICT "efficient" our economic development? (I think we are doing very very well already! However, we should have concrete plan on how government play the role on help economic development.)

How ICT "efficient" the use of e-government services? (We already have so many e-government services, which is doing very well in the World. I think how to make it more user-friendly or even the most user-friendly set as World example is what we should do in next few years)

On the other side, I have to honestly tell you that I cannot see a prosperous picture for future of Hong Kong that can take advantage of digital strategy to lead us to the world leading city in next few years.

ICT is all about the dream and make it happen, it's hardly to see excitement from the document.

Francis
